TITLE: Targeted liposomal constructs for diagnostic and therapeutic uses

Detailed Description Text (2):Preparation of Hepatocyte-directed Liposomes Containing a Serotonin-ATP Complex.Detailed Description Text (3):

Adenosine 5'-triphosphate (ATP) is used as a liposomal sequestrant for serotonin along with the lipid membrane constituents of 69.0 mg of 1,2-distearoyl-sn-glycerol-3-phosphatidylcholine (distearoyl lecithin) and 14.0 mg of dicetylphosphate both from Avanti Biochemicals; 1.0 mg of N-(2,6-diisopropylphenylcarbamoylmethyl)imino diacetic acid and 5.0 mg of cholesterol, both from Sigma Chemical Co. The lipid constituents are solubilized in 1.5 ml of chloroform:methanol solvent (2:1 v/v) from Aldrich Chemical Co. The sample is placed on a Buichi Rotoevaporator and taken to dryness with slow turning under aspirator vacuum at 60.degree. C. Then a solution of 2.4 ml of freshly prepared 40 mM sodium phosphate buffer at pH 7.4 containing 4.2 mg/ml human serum albumin, 10 mg/ml serotonin and at least 14.4 mg/ml of ATP, all from Sigma Chemical Co., is prepared and added to the dried lipid components. The sample is sonicated at setting #4 for 15 minutes at 60.degree. C., using a HeatSystems Ultrasonic/Cell Disrupter equipped with a transducer and cup horn. Next, the sample is annealed at 60.degree. C. with slow turning for 15 minutes to permit the liposomal membranes to become more perfectly formed and more stable. The sample is then centrifuged in a Triac Clinical Centrifuge at the blood setting for 15 minutes at room temperature, and then 1.5 ml of the supernatant material is chromatographed on a 1.5.times.25.0 cm Sephadex G-100-120 column that has been equilibrated with 40 mM phosphate buffer pH 7.4. This first chromatography is performed to remove the untrapped serum albumin and the serotonin-ATP complex. The liposomes are collected and, with respect to the initial concentration on N-(2,6-diisopropylphenylcarbamoylmethyl)imino diacetic acid, they are reacted with a five-fold mole excess of chromium chloride hexahydrate. The purified liposomes containing the serotonin ATP complex were then reacted with a five-fold mole excess of N-(2,6-diisopropylphenylcarbamoylmethyl)imino diacetic acid target molecules. The liposomes are then again rechromatographed using the same buffer to remove unreacted target molecules. The liposomes were stored under nitrogen at 5.degree. C. These hepatocyte-directed liposomes containing the serotonin-ATP complex are diluted with 40 mM phosphate-buffered saline, pH 7.4, prior to the administration to a warm-blooded host.

TITLE: Cystic fibrosis transmembrane conductance regulator (CFTR) protein

Detailed Description Text (15):

FIGS. 7 B, C and D show records representative of many experiments to assess the relationships of the properties of the channel assayed in this way to those exhibited in the patch-clamp experiments with the cells from which CFTR had been purified. Fusion of liposomes without added CFTR (FIG. 7B) failed to produce the appearance of stepwise changes in current levels in the presence of PKA and Mg-ATP (added to both cis and trans compartment in all cases; n=6). Furthermore, fusion of CFTR-containing liposomes without added PKA and Mg-ATP (FIG. 7C) failed to evoke the appearance of single channel currents in 35 experiments in which fusion was achieved. Similarly, the addition of ATP alone, prior to PKA addition did not cause the appearance of single channel steps. Switch-like transitions in current level were only detected following fusion of CFTR containing liposomes in the presence of both PKA and ATP (FIG. 7D). Single channel events were observed in 35 of 45 experiments in which nystatin-induced fusion spikes were observed. Hence, in these experiments approximately 550 independent fusion events were detected and as a consequence 35 low conductance single channel events were detected. No single channel currents were detected in 10 of these 45 experiments due to problems of high noise and bilayer breakage. The mean open probability of the PKA stimulated channel was 0.38 ± 0.13 for five experiments, a value close to that reported by Tabcharani et al (1991) for phosphorylation activated Cl_{sup}- channel in excised patches from CFTR-expressing CHO cells of 0.41.

TITLE: Assay utilizing ATP encapsulated within liposome particles

Abstract Text (1):

An assay utilizing receptor or antibody sensitized liposome particles which have ATP encapsulated therein. The ATP is released by lysing the liposomes, and detected by means of luciferin-luciferase reagent and a luminometer. The assay provides a very sensitive process for detecting the presence of analytes such as antigens and DNA probes.

Brief Summary Text (2):

This invention relates to biological assays. Specifically, the invention employs sensitized liposomes having ATP encapsulated therein for determining the presence of biological analytes such as antigens and DNA probes.

Brief Summary Text (43):

Another option for use of ATP laden immunologically reactive liposomes would involve using them in a heterogeneous assay on strips or membranes which have entrapped or bound thereon the analyte of interest. The liposomes can be reacted with these strips, and after washing, the bound liposomes could be lysed and the released ATP measured in a luciferin-luciferase ATP assay.
